

Hepatitis C Impact in Canada

In Canada, an estimated
250,000 people
are living with chronic hepatitis C

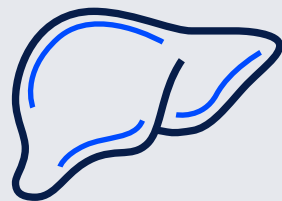

but as many as

40%

are not aware that they have it.ⁱ

What is Hepatitis C?

Hepatitis is a liver disease caused by the hepatitis C virus that attacks the liver.ⁱⁱ

People with hepatitis C often have no symptoms and can live for up to

20 OR 30

years without feeling sick.ⁱⁱⁱ

If hepatitis C is left undiagnosed and untreated, it can lead to
cirrhosis, liver cancer or liver failure.ⁱⁱⁱ

It is the leading indication for liver transplant in Canada.ⁱⁱ

Signs and Symptoms:

People with hepatitis C often have no symptoms. If symptoms appear during the late stage of infection, the damage to the liver can be severe.ⁱⁱ

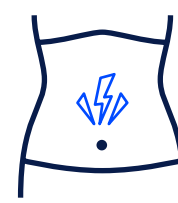

Mild symptoms can includeⁱⁱ:

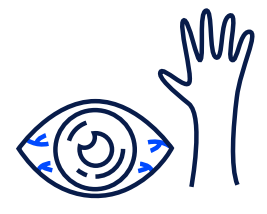

Fatigue

Nausea

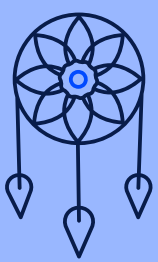

Abdominal pain

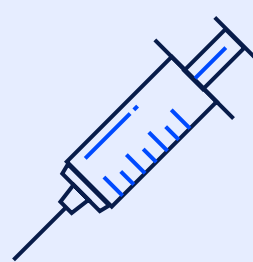

Jaundice

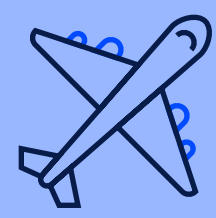

Priority Populations affected by Hepatitis Cⁱ:

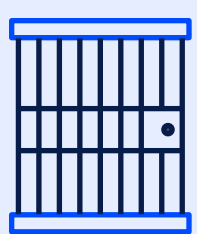

HCV rates are **five times higher** among Indigenous peoples (First Nations, Inuit, Métis).

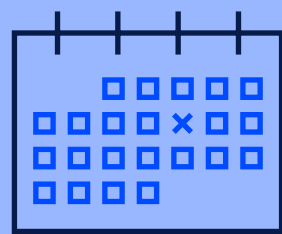

66% of people who inject or use drugs have past or current HCV infection.

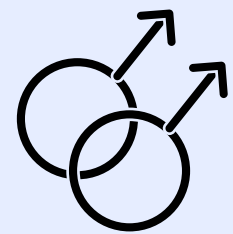

Up to 35% of all HCV infections in Canada are among Immigrants from countries where HCV is common.

Nearly 24% of people with experience in the prison system have a past or current HCV infection.

Up to 75% of all HCV infections in Canada are among people born between 1945-1975.

Approximately 5% of Gay, bisexual and other men who have sex with men (GMSM) have past or current HCV infection.

How do I know if I have Hepatitis C?

It all starts with getting tested.

For more information on hepatitis C testing and/or if you have been recently diagnosed with hepatitis C,
